

Quick guide

removal of adhesive from skin

- Begin by loosening part of the edge of the **Furine External Catheter**.
- Rub the skin along the edge of the catheter with a **Furine Medical Skin Wipe**, while at the same time gently removing the product.
- It may be necessary to use more than one wipe to remove a catheter.
- After removing the catheter, excess adhesive is removed with a wipe.
- NB: it is advised to **only** use **Furine Medical Skin Wipes** to remove the adhesive – and not to use any other adhesive removal solvents.
